# Outline

## 1 Introduction

- Localization and vision
- Initial approach
- Partitioning approach

## 2 Method

- Partitioning
- Localization in each partition
- Localization in the whole domain

## 3 Experiments

## 4 Conclusions

# Outline

- 1 Introduction
  - Localization and vision
  - Initial approach
  - Partitioning approach
- 2 Method
  - Partitioning
  - Localization in each partition
  - Localization in the whole domain
- 3 Experiments
- 4 Conclusions

# Localization

- Mobile robots
- Sensors + Maps
- Localization

# Vision-based localization

## Environments

- Ad-hoc
- Natural
  - Indoor
  - Outdoor

# Appearance based visual recognition

## Visual recognition approaches

- Structural-description
  - Structure from *high level features*
- **Appearance-based**
  - Images or *low level features*

# Omnidirectional images

## Omnidirectional images

- Local views with  $360^\circ$  visibility
- Independence of the direction of the route.
- Convenient representation for rotation-invariant recognition

# Omnidirectional images

# Feature selection approach

## Low level filters

- Nitzberg
- Canny, Gradient
- Color Filters

## Histograms comparison

- 2,4, and 12 bins discretization

# Large environments

# Approach

- Unsupervised partitioning of the environment
- Localization in each partition → multiple hypotheses
- MCL to select a single hypothesis

# Outline

## 1 Introduction

- Localization and vision
- Initial approach
- Partitioning approach

## 2 Method

- Partitioning
- Localization in each partition
- Localization in the whole domain

## 3 Experiments

## 4 Conclusions

# Sequence of images

# Sequence of images

# Sequence of images

# Divide the problem

How to divide the problem?

- Try all possible partitions

- Clustering algorithms

- Look for local variations in the information

# Jensen-Rényi divergence

## Information-theoretic divergence measures

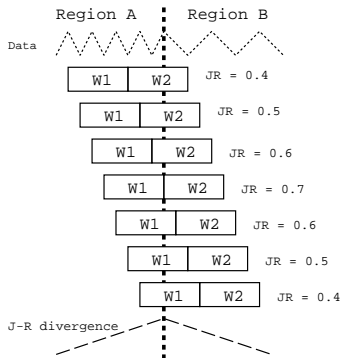

- entropy based
- unfeasible for multidimensional data

## Jensen-Rényi divergence

- $\alpha$ -entropy based
- feasible estimation in high-dimensional spaces (Hero and Michel, 2002)

## J-R divergence applications

- may be defined between any number of probability distributions
- may be used to detect “edges” with a sliding window

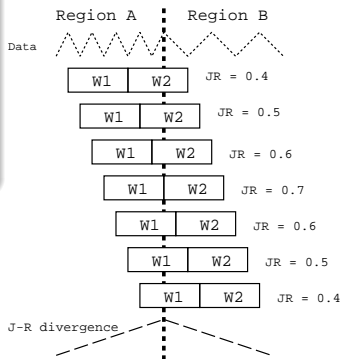

# Jensen-Rényi divergence

J-R divergence simplified  
for two equally weighted distributions

$$JR_{\alpha}(p_1, p_2) = H_{\alpha}\left(\frac{p_1 + p_2}{2}\right) - \frac{H_{\alpha}(p_1) + H_{\alpha}(p_2)}{2},$$

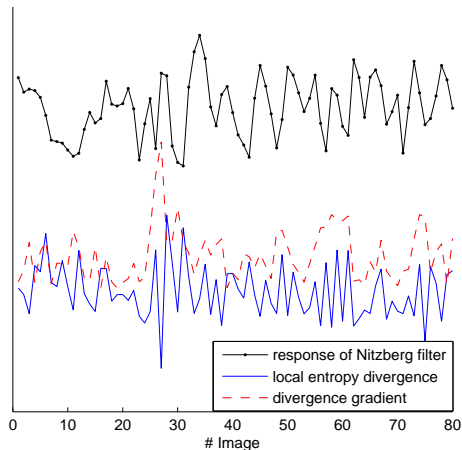

where

- Rényi entropy  $H_{\alpha}$  is estimated with Hero and Michel's method (based on *minimal spanning trees*)
- complexity depending on the number of samples  $O(N \log N)$

# Jensen-Rényi divergence

Response and entropy divergence analysis of Nitzberg filter

# Multiscale Jensen-Rényi divergence

JR-divergence at various window sizes

#241

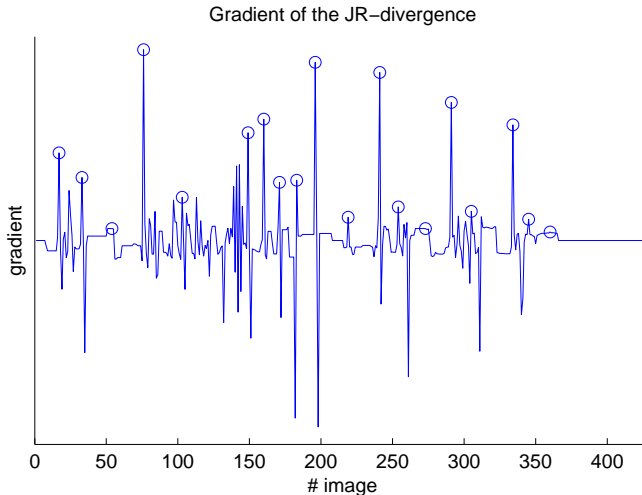

#254

#273

# Resulting partitions

# Resulting partitions

# Feature extraction

## Extraction of global features

# Training

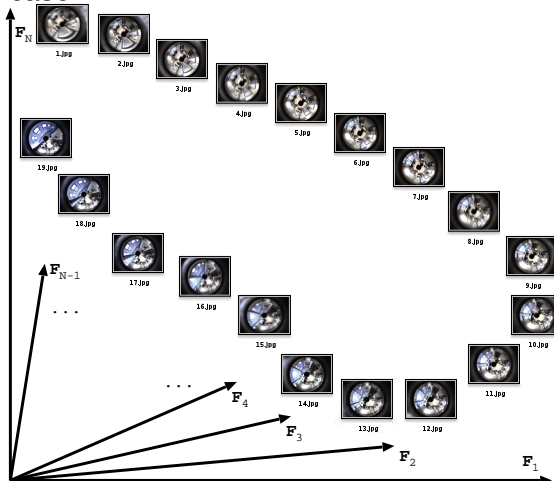

## Selection of features

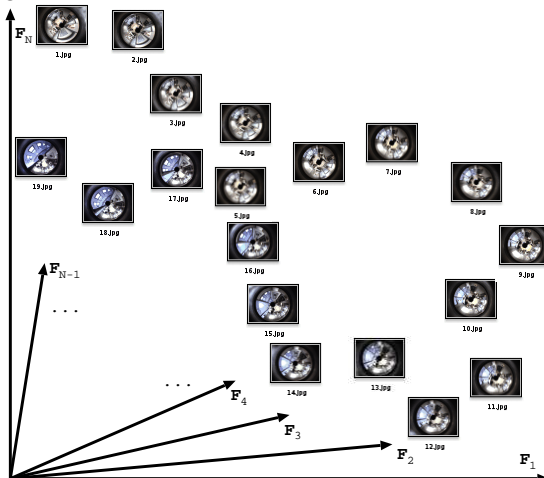

# NNs in the feature space

The ideal case:

# NNs in the feature space

The wrong case:

# Response on the test set

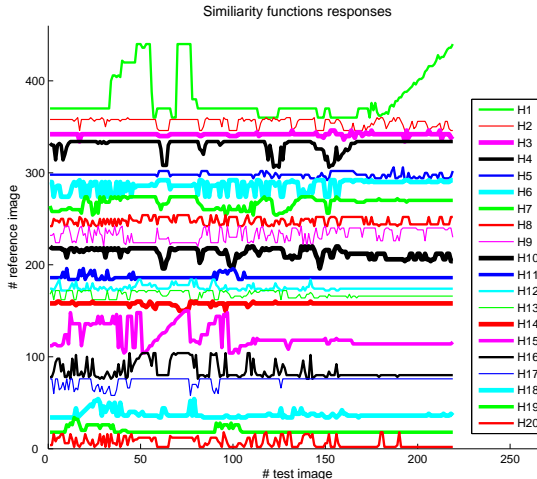

- Classifier trained for images 104 – 148

- Classifier trained for images 001 – 440

# Several localization hypotheses

# Several localization hypotheses

Monte Carlo Localization, given:

- A motion model
- A likelihood function for a given position

# Outline

## 1 Introduction

- Localization and vision
- Initial approach
- Partitioning approach

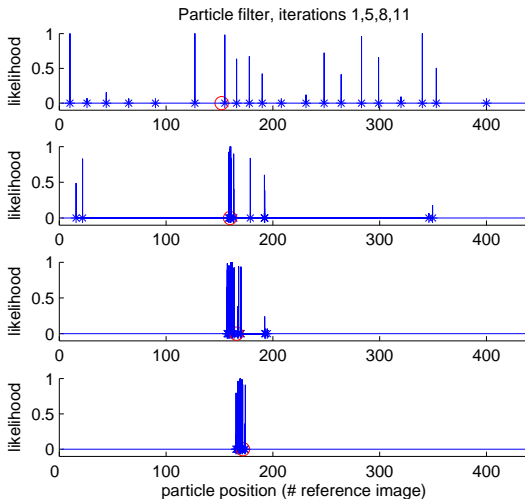

## 2 Method

- Partitioning
- Localization in each partition
- Localization in the whole domain

## 3 Experiments

## 4 Conclusions

# MCL algorithm for disambiguation

# Single classifier

# Outline

## 1 Introduction

- Localization and vision
- Initial approach
- Partitioning approach

## 2 Method

- Partitioning
- Localization in each partition
- Localization in the whole domain

## 3 Experiments

## 4 Conclusions

# Conclusions

## Visual localization approach

- Scalability
- Unsupervised IT-based partitioning
- Fast image recognition,  $\approx 0.1$  sec
- Suitable for corridor-like scenarios

## Future work

- Generalize to 2D scenarios

# Large Scale Environment Partitioning in Mobile Robotics Recognition Tasks
